

Lab Exercise – Chapter 2a

1. Given a structure a specification to store the details of 3 students (Rollno, name, marks in five subject, DoB - which its type is Date struct), write a program to input each student's detail using function and perform the following;
 - a. Compute average score of their marks for each student and print the students' details in tabular format along with their scores
 - b. Determine and print student's details who scored average mark below 50
2. Write a program to print the area of a rectangle by creating a structure named 'Area' having two functions.

First function named as 'setDimention' takes the height and width of the rectangle as parameters and the second function named as 'getArea' returns the area of the rectangle. Width and Height are entered through keyboard.

3. Write a C++ program to manage employee records using structure and functions with the following descriptions. read 3-employee's data
- Define a structure named Employee with members: id, name, educationLevel and salary
 - Input employee data using inputEmployees(Employee emp[], int n) function, use array of structure
 - Create a function to calculate the net salary of employees (netSalary= gross salary-incomeTax-pension, where pension is 7% of salary and incomeTax is 10% for gross salary of 5,000-10,000, 15% for gross Salary of 10,000-15,000, 20% for 15,000-20,000, 25% for 20,000-25,000 and 30% for gross salary $\geq 25,000$)
 - Create a function to display employee records in a tabular format
- N. B Apply concepts passing structure as parameter, returning structure from function, using pointer to structure and call by reference
