

Lab Exercise – Chapter 2 and 3

1. Write a structure to store the name, account number and balance of two customers and store their information.
 - a - Write a function to print the names of all the customers having balance less than \$200.
 - b - Write a function to add \$100 in the balance of all the customers having more than \$1000 in their balance and then print the incremented value of their balance. Use pointer as a variable of the structure
2. Write a C++ function named larger() that returns the later date of any two dates passed to it. For example, if the dates 10/9/2005 and 11/3/2005 are passed to larger(), the second date is returned and Store the Date structure returned by larger() in a separate Date structure and display the member values of the returned Date. Use pointer as a variable of the structure.
3. Define a class product with three members(name, cost, quantity) and define the following functions:
 - getData(), DispData(), calcRevenue() where $R = \text{cost} * \text{quantity}$, calcTax()(where tax=15% of Revenue), calcProfit() and Do it for N-products
4. Assume there are a medical data set(patientID, name, age, and diagnosis) stored on cloud (server computer). A client computer access and process each data groups independently. Use a class data type to demonstrate this scenario.
5. Write a program that accept N student record from the keyboard & store the list on a file "Test.txt" in a text file format. Also write another program that reads students record from the text file "Test.txt" and display on the screen. (tip: create a header file which contain definition of two function getRecord() and displayrecord() and include it in your program).
