

Lab Exercise Chapter 4b

1. Write a function template `palindrome` that takes a vector parameter and returns true or false according to whether the vector does or does not read the same forward as backward (e.g., a vector containing 1, 2, 3, 2, 1 is a palindrome, but a vector containing 1, 2, 3, 4 is not).
2. Write a template function called **`findLargestElement`** that accepts a vector as a parameter and returns the largest element in that vector. Write a driver program to test your function.
3. Write a program that demonstrate different operations in three sets s1,s2 and s3.
4. Write a program that uses the map template class to compute a histogram of positive numbers entered by the user. The map's key should be the number that is entered, and the value should be a counter of the number of times the key has been entered so far. Use -1 as a sentinel value to signal the end of user input. For example, if the user inputs: 5, 12, 3, 5, 5, 3, 21, -1, then the program should output the following (not necessarily in this order):

number	occurs
3	2
5	3
12	1
21	1
